

Printechs Website – Phase F3

SUMMARY

Create a premium reusable Product Detail Page System for the existing Printechs website without rebuilding from scratch, reusing existing architecture, and maintaining consistency across industrial, retail hardware, and software product types via one configurable page architecture.

OBJECTIVE

Create a premium reusable Product Detail Page System with a modern international B2B technology company visual direction; premium, clean, professional, modern, technical, enterprise-focused, easy to scan, image-led, conversion-focused, suitable for Saudi Arabian B2B customers.

IMPORTANT DESIGN PRINCIPLE

Do not create completely different templates for industrial, retail, and software products; create one reusable product-detail architecture with configurable sections.

GLOBAL WEBSITE DESIGN

Use existing Printechs logo, header, navigation, footer, typography, brand colors, and button styling. Max content width approximately 1280px–1440px. Standardized design tokens for colors, spacing, radius, and status colors.

PRODUCT PAGE ROUTING

Create reusable route compatible with existing architecture. Preferred conceptual structure: /products/[category]/[product-slug] and /software/modern-pos; do not change existing URLs if routing convention already exists.

SECTIONS REQUIRED

Include configurable sections: Breadcrumbs, Product Hero, Hero Trust Indicators (optional), Key Value Cards, Product Story/Visual Feature (optional), Key Features & Specifications, Full Technical Specifications (optional), Applications/Industries, Software Capabilities (optional), Key Capabilities, Accessories (optional), Compatible Hardware (optional), Services & Support, Related Products, Downloads (optional), Final CTA.

COMMERCIAL RULE

B2B only. Do not display prices, cart, add to cart, buy now, checkout, or consumer e-commerce features. Primary CTAs: Request a Quote, Talk to a Specialist, Book a Demo, Contact Us, Download Datasheet.

REQUEST A QUOTE BEHAVIOUR

Request a Quote must carry product context: product name, product code if available, brand, category, and current page URL; reuse existing quotation/contact mechanism if present.

PRODUCT DATA MODEL

UI should accept structured product data including product_name, product_code, slug, brand, category, subcategory, product_type, short_headline, short_description, long_description, hero_image, gallery, datasheet, brochure, video_url, features, key_specifications, full_specifications, applications, industries, accessories, compatible_hardware, downloads, support_services, related_products, SEO fields; sections auto-hide when no content exists.

PRODUCT TYPES

Support industrial, retail_hardware, software, and generic types using one page component with conditional sections, not duplicated templates.

ERPNext FUTURE INTEGRATION

Frontend should be ready for future ERPNext-driven content via clean service/data layer. Avoid risky backend changes now and do not modify standard ERPNext DocTypes unnecessarily.

RESPONSIVE / PERFORMANCE / ACCESSIBILITY / SEO

Responsive layouts across desktop/laptop/tablet/mobile, optimized image handling, subtle micro-interactions, semantic structure with one H1, metadata and structured data support, performance-focused implementation, and accessibility requirements (contrast, keyboard focus, headings, alt text, touch targets).

IMPLEMENTATION APPROACH

Step 1 Audit existing project; Step 2 Shared components; Step 3 Product data layer; Step 4 Universal page assembly; Step 5 Industrial demo; Step 6 Retail hardware demo; Step 7 Software demo; Step 8 Responsive refinement; Step 9 SEO & performance; Step 10 QA via build/lint/tests.

DEVELOPMENT DEMO PRODUCTS

Implement three demos: Hitachi UX-D161W (industrial), Datalogic Memor 12 (retail_hardware), Modern POS (software), all using same site design language with varying enabled sections.

EXPECTED RESULT / REPORTING

Deliver three working product-detail examples and report files created/modified, routes, reusable components, data structure, reused components, placeholders, backend/API dependencies, build/lint errors, and recommended next phase.
